A STUDY ON IMPACT OF PARENTING STYLES AND SELF-ESTEEM ON ACADEMIC ACHIEVEMENT OF POSTGRADUATE STUDENTS

Abstract

This study demonstrates the impact of parenting styles and self-Esteem on academic achievement of postgraduate students. The purposive sampling technique was used and a sample of 150 (75 male and 75 female) students was selected from the Islamia University of Bahawalpur, Pakistan. The questionnaires on parenting style and self-esteem (Buri, 1991; Rosenberg, 1965) were administered to collect the data. The data analysis revealed insignificant relationship between self-esteem and academic achievement. Statistically (as $\beta = -.132$, $P = .259$, $p > \alpha$) self-esteem was not found to be a significant predictor of educational success and failure of the students. Contrary to this a significant relationship between authoritarian parenting style and academic achievement of students was found (male $\beta = .992$, $P = 0.00$, $p < \alpha$; female $\beta = .985$, $P = 0.00$, $p < \alpha$) for both of the genders. But an insignificant relationship of authoritative parenting style with academic success or failure of students (of both genders) existed. Hence, it is concluded that authoritarian parenting style has significant impact on academic achievement of students.

Keywords: Authoritarian Parenting Style, Authoritative Parenting Style, Permissive Parenting Style, Explicit Self-Esteem, Implicit Self-Esteem, Student's Academic Achievement

Introduction

Apparently, parenting style directly contributes towards growth and development of children and adolescents including their education, and overall health and well-being. Parenting style seems to have an impact on learning of children by addressing their emotional, behavioral and psychological problems.
